* **Combine layers:** You can create an image by merging two or more layers together. For example, you can blend a portrait photo with a landscape photo to create a family photo. Or, you can blend a photo of a clothing model with a background to create a flattering picture for a magazine ad. * **Fill:** A powerful feature of Photoshop is the ability to fill in areas of any object, whether it's a background or foreground object (like the portrait) or a layer that includes a photo of an object (like the clothes model). The Fill feature lets you render a colored background area that looks as if it was drawn on the photo. Or, you can fill in the area of an object that would normally be an object's texture. * **Overlay:** To keep track of what you just did, the Overlay tool helps you establish the working area for your work. For example, if you blend a photo with a background, the Overlay tool lets you select that working area. If you create a new layer and paint over the image, that layer is now the working area, and you can easily select it by using the Overlay tool. * **Edit:** This tool enables you to crop, rotate, resize, and zoom the image. However, unlike most other graphics tools, Edit works in the background, which is useful when you need to experiment with different image sizes and positions as you edit. * **Smart Brush:** This tool lets you select an object, and then the Smart Brush creates an effect over the selected object. An object is the layer you select as the working area. For example, if you select a face in an image as the working area, you can use the Smart Brush to create the appearance of a smoky eye, which simulates the effect created when you gaze into the sun.

Effect of the frequency of female reproductive cycles on the reproductive success of male Mexican beaded lizard (*Ancistrodon fasciatus coreanus*). We studied the effect of the frequency of female reproductive cycles on reproductive success in order to test the hypothesis that a male is more successful in copulating when he mates with a female in the luteal phase of a cycle than when mating with a female in the inter-luteal phase. The hypothesis was supported by the result that the male's success rate was higher in the luteal phase than the inter-luteal phase. The rate of implantation in the luteal phase was higher than in the inter-luteal phase. The male's success rate was lower at both the inter-luteal phase and the follicular phase than at the luteal phase. The result shows that the female tends to mate with a male when she is in the luteal phase.

Q: How to parse json string where the return value is parent object? I'm trying to parse the data returned from a web service. I keep receiving a "can't deserialize json object". [{"id":"1827","name":"Nils","age":20,"employer":"Google","email":"nils@google.com"}]

Q: Connect the following equations The following is a question from a textbook. I'm just stuck on it. I also tried drawing a scatter plot and I don't really know how it could help in answering the question. A: Good guess! The equation is asking to find x, y , for the point with coordinates $(x, \frac{y}{2})$. Since the equation is a plane, the system should be able to be solved by setting the two co-ordinates equal to one another. Which gives: $x = \frac{y}{2}$. Plug that into the other equation, and you get the line: $x^2 - 2y^2 + 1 = 0$

To find all the x, y pairs that lie on the line, you want to find the roots of the above equation. First, find the discriminant of the quadratic equation: $\Delta = 4y^2 - 4$. It is positive when y is between $-1/2$ and $1/2$. Second, it is easy to find where these x, y pairs are: $x = \pm \sqrt{\Delta} = \pm \frac{1}{2} \sqrt{4y^2 - 4} = \frac{y}{2}$

You can also write the equation in terms of x, y : $x^2 - \frac{1}{2} y^2 + 1 = 0$ as the vertical line between the points: $(x, y), (x, -y/2)$.

Q: A packet sent through the Raspberry Pi's WLAN is being discarded I have two Raspberries Pi3 with the same firmware and the same OS. Both configured with WLAN. The first Raspberry Pi is set as Server and the second is configured as Client. The client is set to only communicate with the server and tries to connect to the specified IP to establish a TCP connection. The client successfully establishes a connection to the server, it detects the "client" role of the server but I don't receive any "ACK" packet. After some retries I tried to send a ping packet from the client to the server and the server should send a "Pong" response back to the client. But the packet is discarded by the server.
