Tart is a validation, diagnostic, and troubleshooting web service. It is a "whole site checker" or "page tester". It works with almost every web-based service known to man. It runs the tests of every major web-browser and OS using a small WebTest plug-in. The diagnostic tool provides all necessary HTML and CSS documentation for assistance in troubleshooting problems. It uses many other services. It includes DHTML validation, HTML Tidy, CSS Tidy, and W3C validation in one package. Managing content on the web has become increasingly difficult as more people rely on the Internet for staying in touch with others and as more content is available via the Web. Tart not only provides a solution to the technical side of problem, but also helps people to understand the subtleties of Internet management and how to achieve greater business results with their online presence. So, what is it that I'm not seeing? Is it the user interface? I like its intuitive style. I looked for another program like it, and found a few - except none of them had the following features: the user could save their web pages as "text", could test websites as a very simple wizard, had submenus to modify settings (like html and css), had HTML Tidy, could create dictionaries with browser detection, and had an item for a simple "text 09e8f5149f
