Twisted Keygen Full Version

This page will show you how to make a basic Twisted server, as well as provide pointers on further features of the Twisted framework. It is written using Twisted 17.5.0. Basic Example The following code is a basic example of a simple Twisted server. It just returns the greeting message. """ This is a basic example of a simple Twisted server. """
from twisted.internet.protocol import Protocol, ServerFactory from twisted.internet import reactor class Echo(Protocol): """ A simple echo server. It simply returns whatever it receives. """ def dataReceived(self, data): self.transport.write(data) self.transport.loseConnection() factory = ServerFactory() reactor.listenTCP(8000, factory) reactor.run()
A Few Tips Create a loop around the reactor.run() statement. If you have to kill the program (for whatever reason), or if the program isn't able to start for any reason, it will be easier to just kill the loop. The easiest way to work out the code for yourself is to open it up in a Python shell, and just type line by line. It is useful to always include a comment block (//) at the start of the program, and end it with a second //. These comments will be displayed in the output when the program is run. Some of the more advanced features of Twisted can be found in the examples directory. A: You can also use the following construct for a wrapper to listen on a TCP port: from twisted.internet.protocol import ServerFactory, StreamPairProtocol from twisted.internet import reactor def listen(port): """ Listen for and accept new TCP connections. """ proto = ServerFactory() print "listen: ", port proto.protocol = StreamPairProtocol(reactor, proto) proto.factory.protocol = StreamPairProtocol(reactor, proto) reactor.listenTCP(port, proto) reactor.run() A
